. \*! This will add a large group of tools to the training ground. You must set the value of m\_trainer to "stronghold crusader" \*!  
@warning That trainer is more stable than any other, so be very careful in its use! It can have performance issues. \*//  
CINELIBRARY DLLAPI void WINAPI SendTrainingGroundLevelToTrainer(DWORD trainerID, DWORD level); /// @ } ///  
@addtogroup libdemo /// @ { /\*\* @defgroup LibDemo Samples These are all the training samples for the sample projects. Not  
all of them are released to you yet, so use them at your own risk! Note that in the typical demo project, the samples project files  
aren't in the same folder as the main DLL, but are instead found in a "Trainers" folder on your install directory. @ingroup  
LibDemo \*/ /\*! @ } #endif \_\_cdecl\_ #endif \_\_tilt\_ #endif \_\_LIBDEMO\_ Q: Why do I need an if statement when  
comparing variables? for example : if(size > array.length){ size = array.length; } Why not just : size = size > array.length?  
array.length : size; A: Here you may need if because you are making a test for two values: "size" is bigger than "array.length" or  
"size" is smaller than "array.length". But if you write: if (size > array.length) Your code could be: if (size >= array.length)
